Today in Brazil there is a lot of pollution!

Today the factories are taking the places of the forests, the materials used for them are causing major environmental damage. Much of the factories are not realizing that they are taking the habitat of thousands of animals.

Cruises pollute the seas when will oil spill.

***Oil is not recyclable,
but there are already many solutions
as the water moved,
that greed is only
so much that they
bought the idea and eliminated cars.***

Today dumps are already found for each material to facilitate recycling time

organic

plastic

paper

glass

metal

Oil was formerly played by the kitchen sink, which pollute the water. but nowadays, the oil can be recycled and Brazil classified this as the place that recycles more oil. one of the products made from this oil is soap.

then reduce,
reuse and
recycle.
because if not
our world will
become a
huge garbage
dump

batteries are recyclable, but most people do not recycle.

a stack takes 450 years to decompose when discarded in dumps or landfills, they release toxic compounds that contaminate soil

THE

END
